SUMMARY

Software Engineer with ten years of experience designing, building and releasing scalable full-stack systems across Java, TypeScript/Angular and cloud infrastructure. Owns software end to end — system design, code and design reviews, CI/CD, production releases and incident support — within Agile teams. Mentors engineers and has published peer-reviewed research in the security domain.

SKILLS

Languages: Java, TypeScript, JavaScript, SQL, Apex, Python (Intermediate)

Frameworks & Libraries: Angular 19, PrimeNG, RxJS, NgRx (SignalStore), React, NextJs, Material UI, Spring Boot & its modules, Hibernate, REST APIs, Swagger/OpenAPI, Apache Camel, Citrus, Cucumber, Jasmine, Jest, JUnit, Mockito

Cloud & DevOps: Amazon Web Services (EC2, EKS, S3, RDS, IAM, VPC, Lambda), Docker, Kubernetes, OpenShift, AzureDevOps, GitHub, Jenkins, ArgoCD, Maven, Vault, Datadog, ElasticSearch, MinIO S3

Data & Messaging: SqlServer, IBM LUW, MySQL, Oracle 12c, Couchbase, Redis, Kafka, IBM MQ, MuleSoft

Practices: System design (high & low level), event-driven architecture, microservices, Agile/Scrum, test-driven development, code reviews

AI: Learning RAG pipeline design with vector databases (embeddings, chunking, retrieval) and LLM API integration into application backends (personal project)

WORK EXPERIENCE

Senior Software Developer, Winsupply **April 2025 - Sept 2026**

- Built Java 21/Spring Boot 3.4 microservices for invoicing and sales-order tax calculation, owning each change from design through production, backed by IBM LUW and SQL Server.
- Built a Java tax API on the Vertex engine covering all US states and local jurisdictions, plus PDF generation for itemized invoices and automatic payment receipts.
- Designed the service architecture that cut latency by 40% and raised throughput, moving invoicing data to downstream consumers over IBM MQ queues and Kafka topics, exposed through a MuleSoft API gateway on Kubernetes and secured with Okta (OAuth 2.0) and AMS.
- Built a bill pay service that sends daily, weekly and monthly email notifications with invoices and statements based on customer preferences.
- Built fault-tolerant replay microservices that store failed requests in MinIO S3 and reprocess them through Java scheduler microservices, with alerts to dedicated email and chat channels.
- Built Angular 19 applications for POS device management across 600+ stores and for tax adjustments on invoices, using reactive forms, NgRx SignalStore and RxJS.
- Containerized Node and Java Spring Boot apps with Docker and built GitHub Actions CI pipelines that publish images to Sonatype Nexus; owned releases through ArgoCD (Vault-managed configuration, rollbacks) and production monitoring in Datadog and ElasticSearch.
- Authoring design documents and leading code reviews for the team.

Senior Software Engineer, NttData **Jan 2023 - April 2025**

Client: UPS

- Led the redesign of a monolithic package-routing application into microservices, increasing efficiency by 15%, on Java 15 and Spring Boot 3.2 with Apache Camel for routing, and added JUnit, Citrus and Cucumber tests to raise coverage ahead of each release.
- Modernized an Angular 17 application with signals and store based state management and service workers for CSV generation and downloads, increasing application efficiency and user experience.
- Built Azure DevOps CI pipelines (YAML) for Java, Node and .NET, using Docker to build images, and onboarded microservices from other UPS teams, plus a React 17 app for JFrog artifact deferral.

NttData Employee Timesheet Project

- Built Java and Spring Boot microservices for employee timesheets and account data; deployed 3 Java applications on AWS using EKS and EC2.
- Used RDS as the transactional database, S3 for static assets and tax and payroll PDF exports, and IAM and VPC for access and network isolation.

Client: Florida Department of Corrections

- Designed and built a robust Angular 17 application for managing prisoners' data (tracking, releases, rosters) that lets government officials validate it, reducing manual effort by about 50%.
- Collaborated with cross-functional teams through sprint planning, backlog refinement and demos, achieving project success rates of 100%.

Senior Java Developer, Nexient **Dec 2018 - Dec 2022**

Client: UPS

- Designed and built Spring Boot transit network APIs for moving UPS packages, cutting latency by 25%, with Oracle 12c via JPA, native queries and stored procedures, JWT authentication, and deployment to on-premise Linux servers.
- Built flight crew APIs and Angular 17/Material UI 17 screens to monitor crew schedules, pickups, drop-offs, layovers and rosters, while mentoring 3 engineers through code and design reviews.
- Built crew-data Spring Boot APIs with Hibernate and Oracle 12c, with a Couchbase cache in front, as containerized microservices.

Client: Home Depot

- Built an Apex-based Salesforce API for mapping SKUs to inventory products and creating customer orders; mentored a team of 2 and managed timelines, cutting delivery times by 30%.

Software Developer, Dell Services **Dec 2014 - Jul 2016**

Client: Hilton Hotels

- Built real-time room reservation functionality on Java and Spring Boot microservices based on dynamic room availability, improving performance by 50%; built Angular 2 login and user profile pages with form validations.

EDUCATION

M.S. Computer Science, University of Toledo, *GPA 3.8/4* — thesis "Digital Drone Forensics" **Aug 2016 - May 2018**

B.Tech Electronics & Communication, Sharda University, *GPA 3.5/4* **May 2010 - Jun 2014**
